# Remember Histograms?

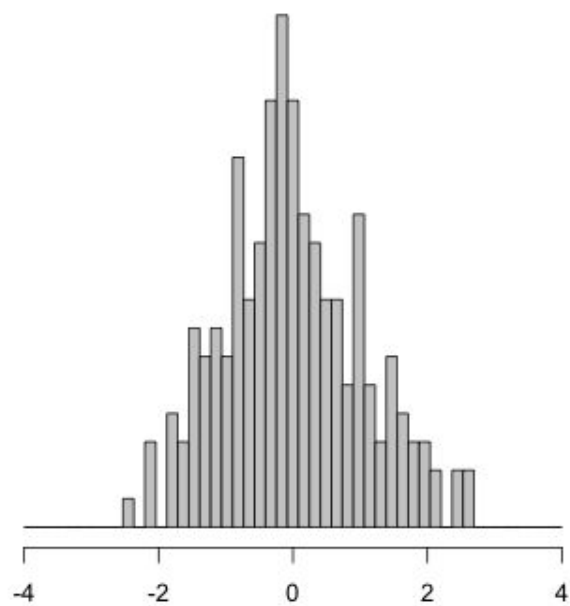

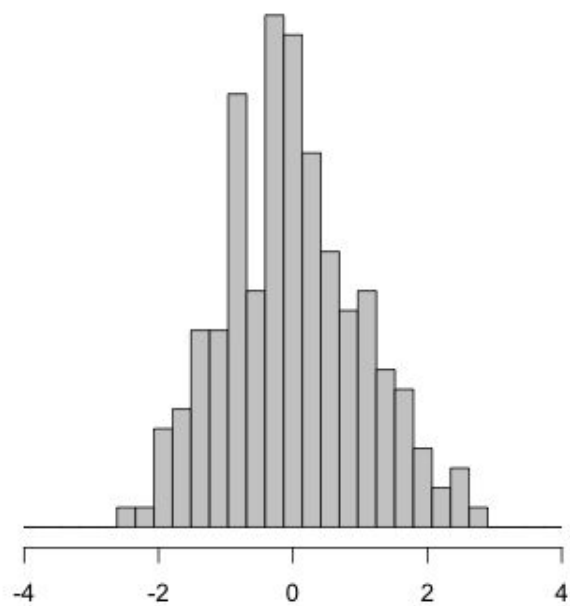

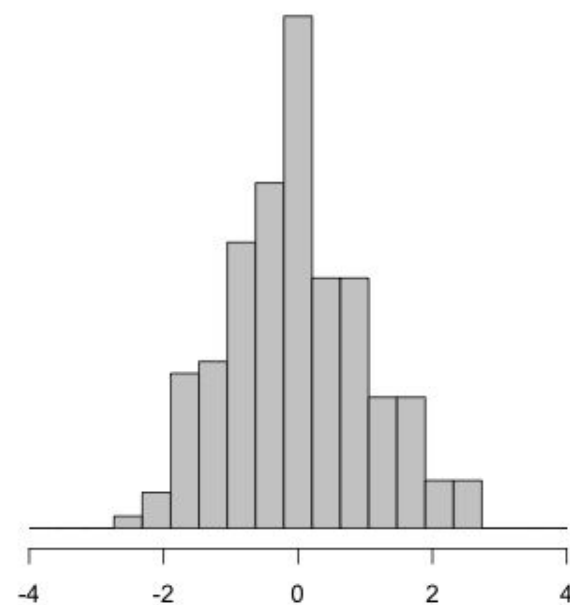

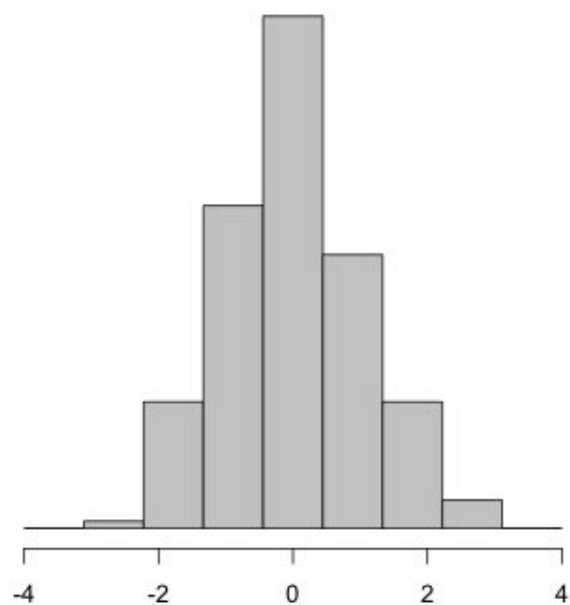

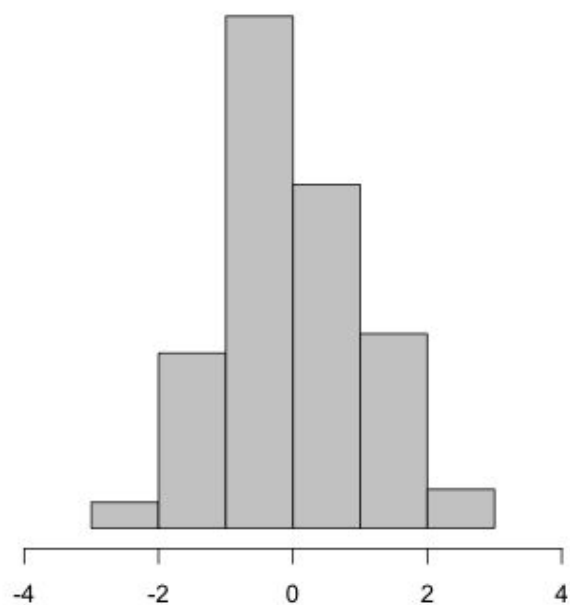

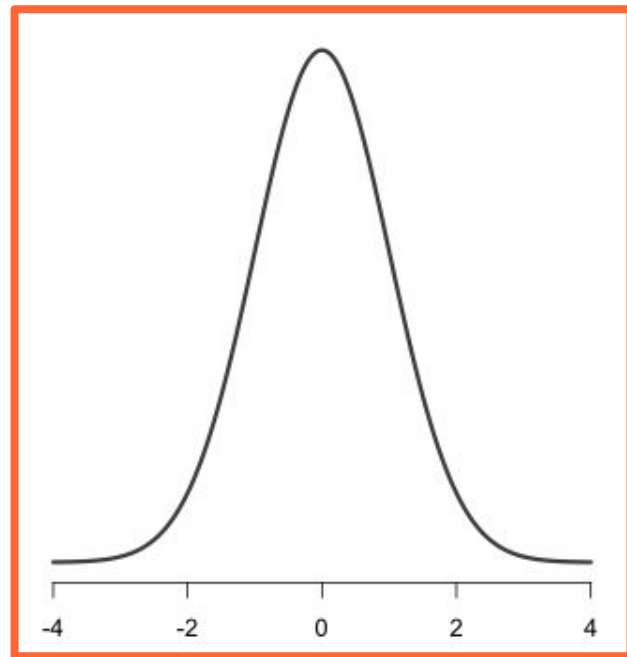

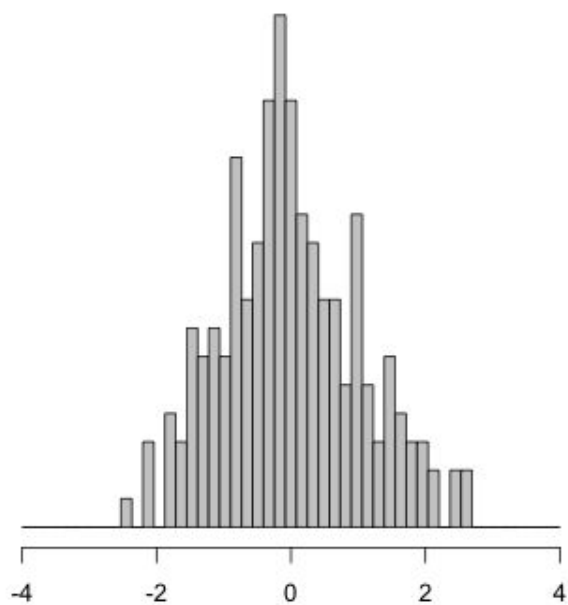

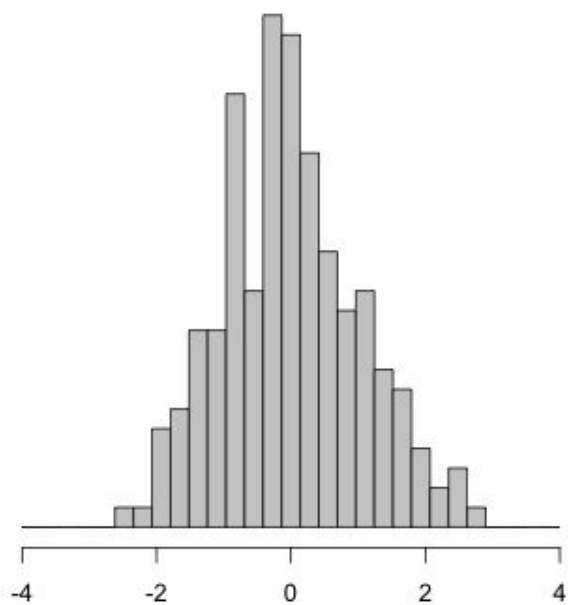

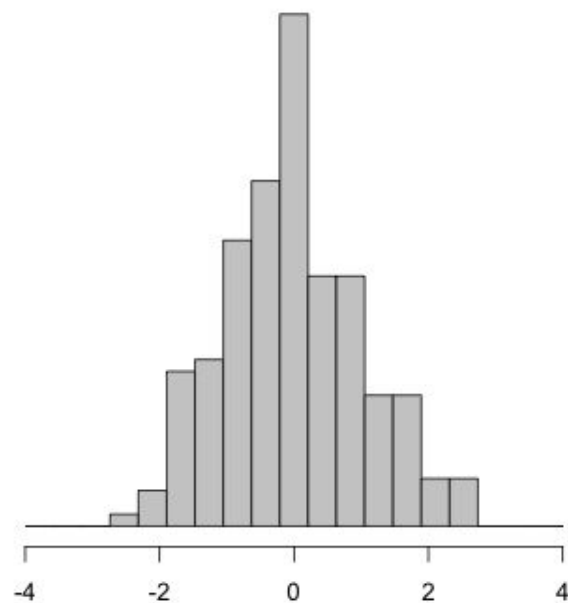

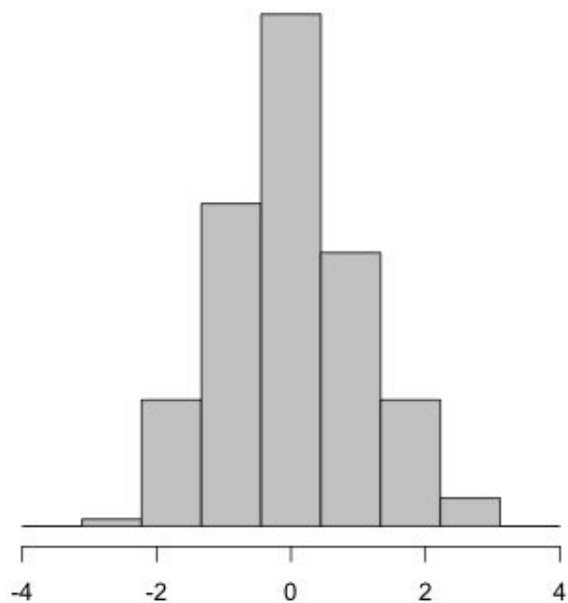

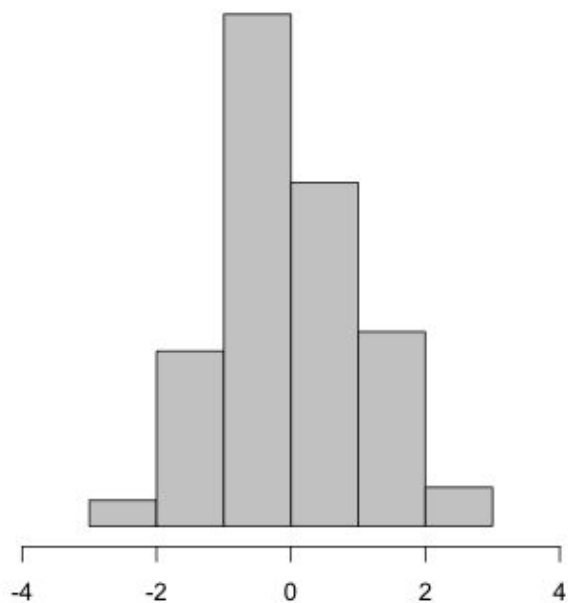

Roughly Symmetric distribution

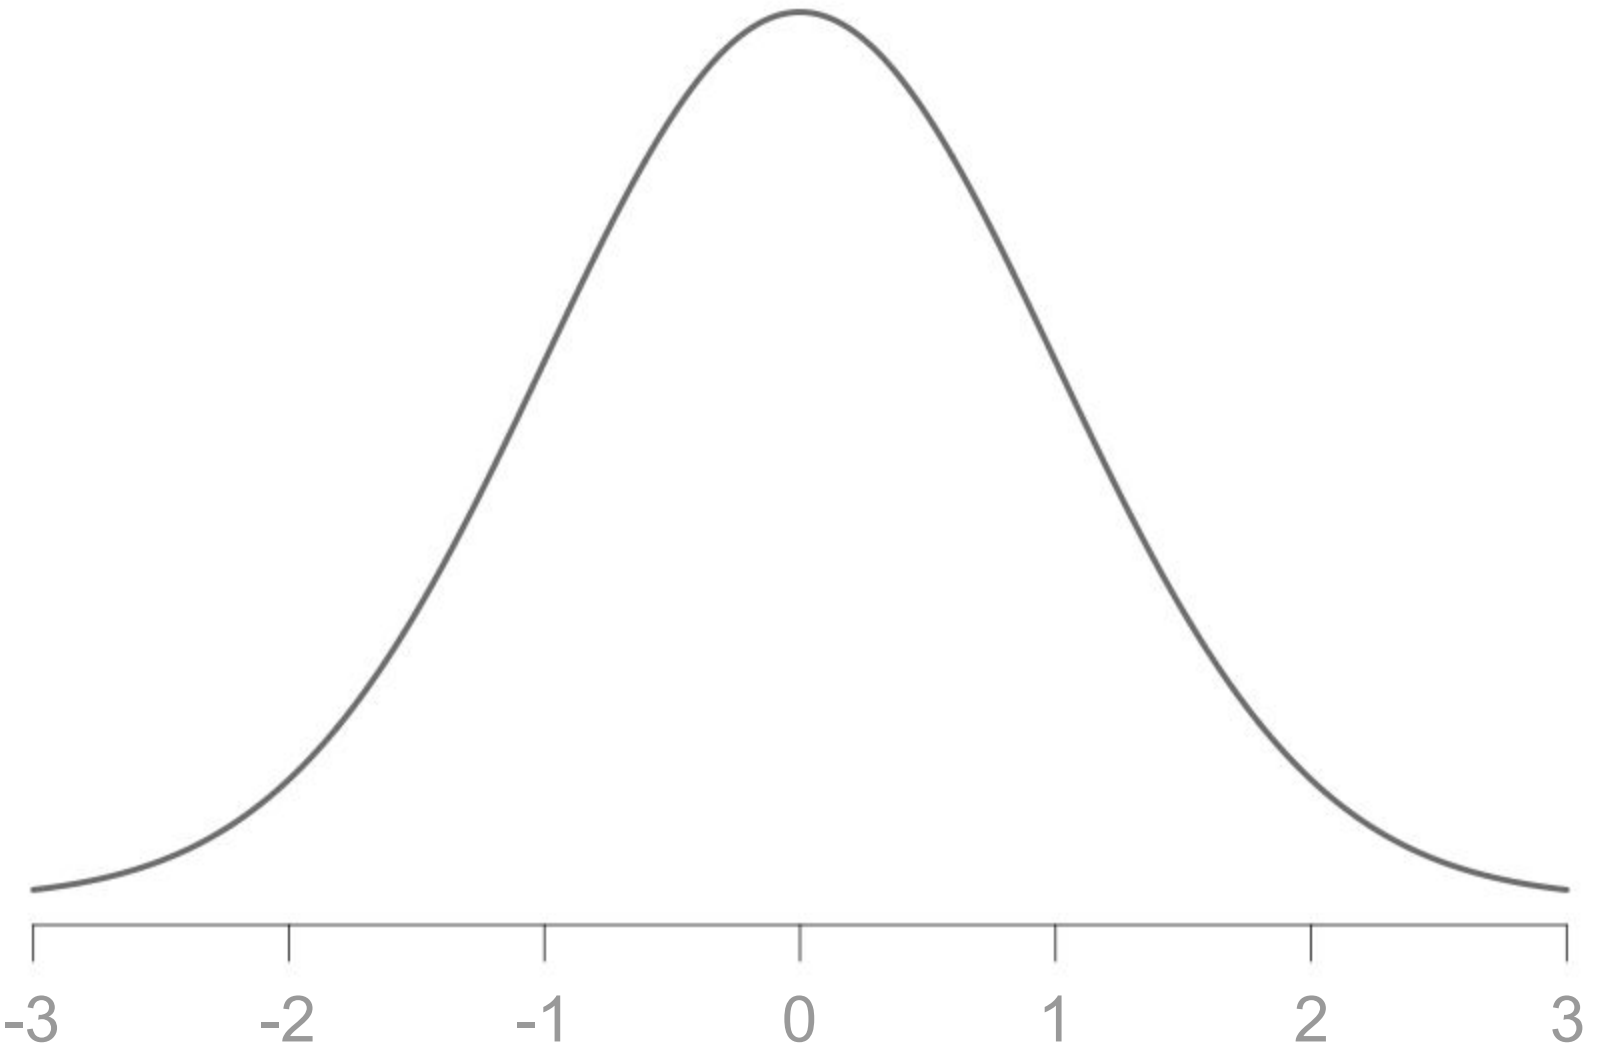

Many variables have  
histograms that look  
like the normal curve

# Demo with NBA players data

# Normal Curve

One special type  
of “histogram” ...

# Normal Curve

## Normal curve equation

$$y = \frac{1}{\sqrt{2\pi}} e^{-\frac{1}{2} x^2}$$

# Normal curve equation

$$y = \frac{1}{\sqrt{2\pi}} e^{-\frac{1}{2}x^2}$$

constant

maximum  
at  $x = 0$

positive

decreases  
very fast

(never gets  
to zero)

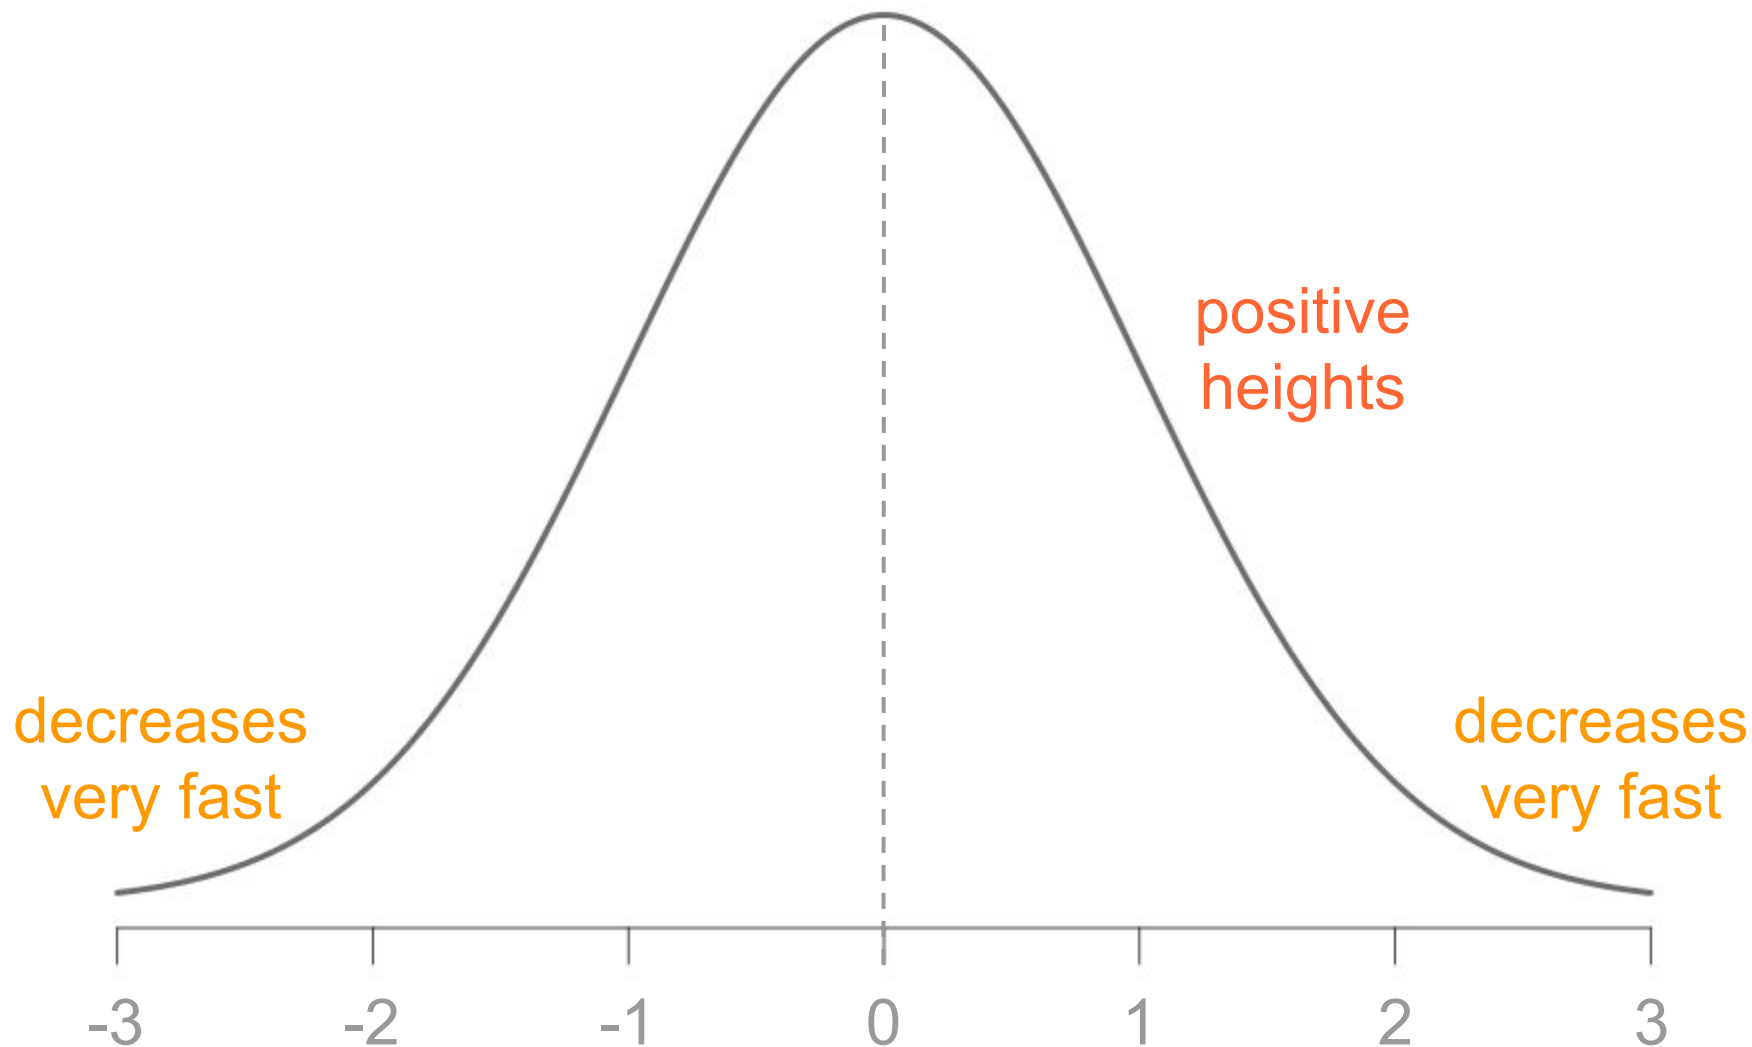

# Normal Curve

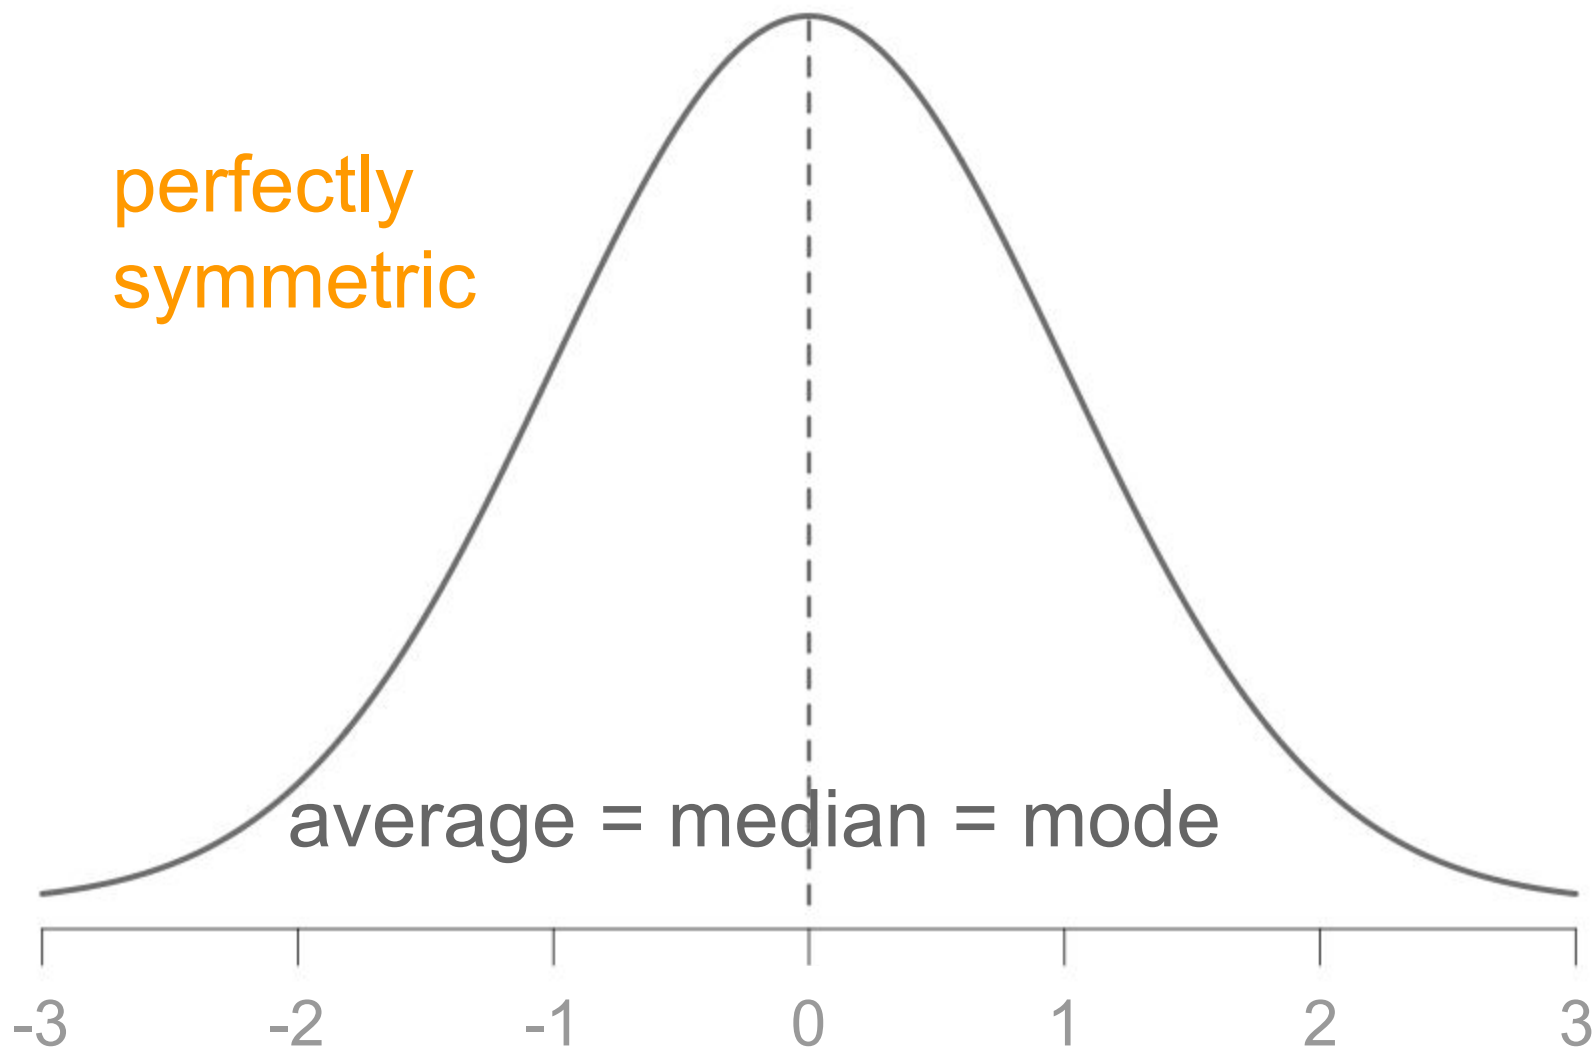

# Normal Curve

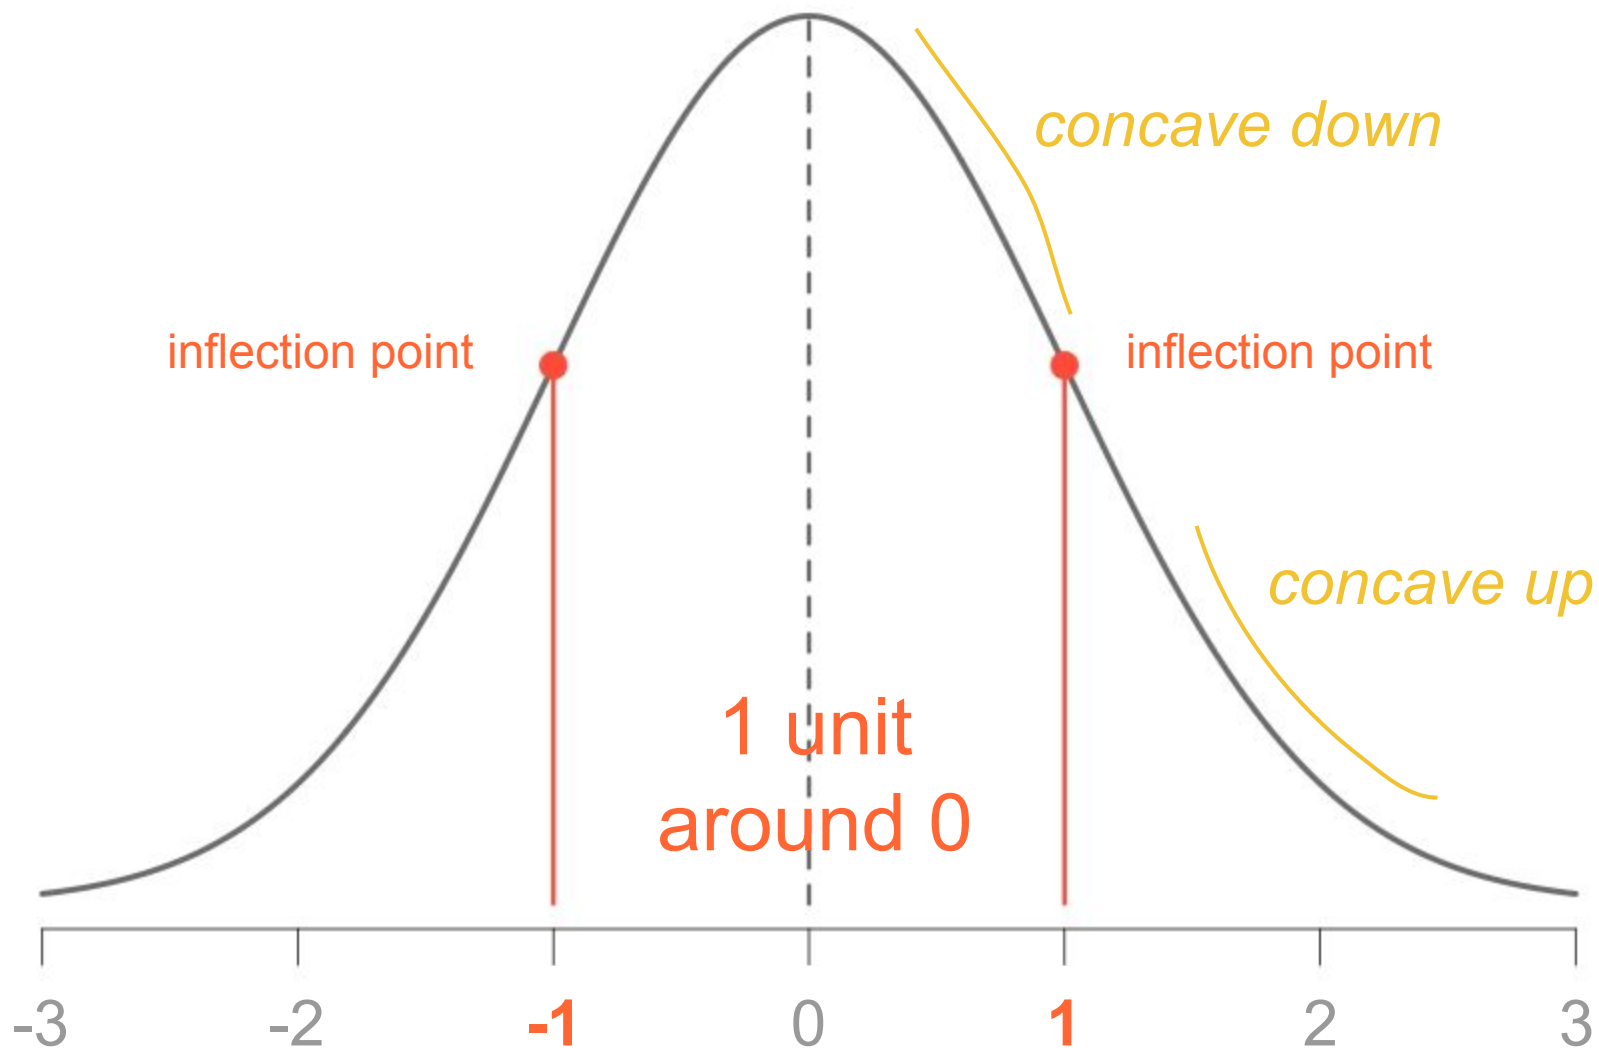

maximum at  $x = 0$

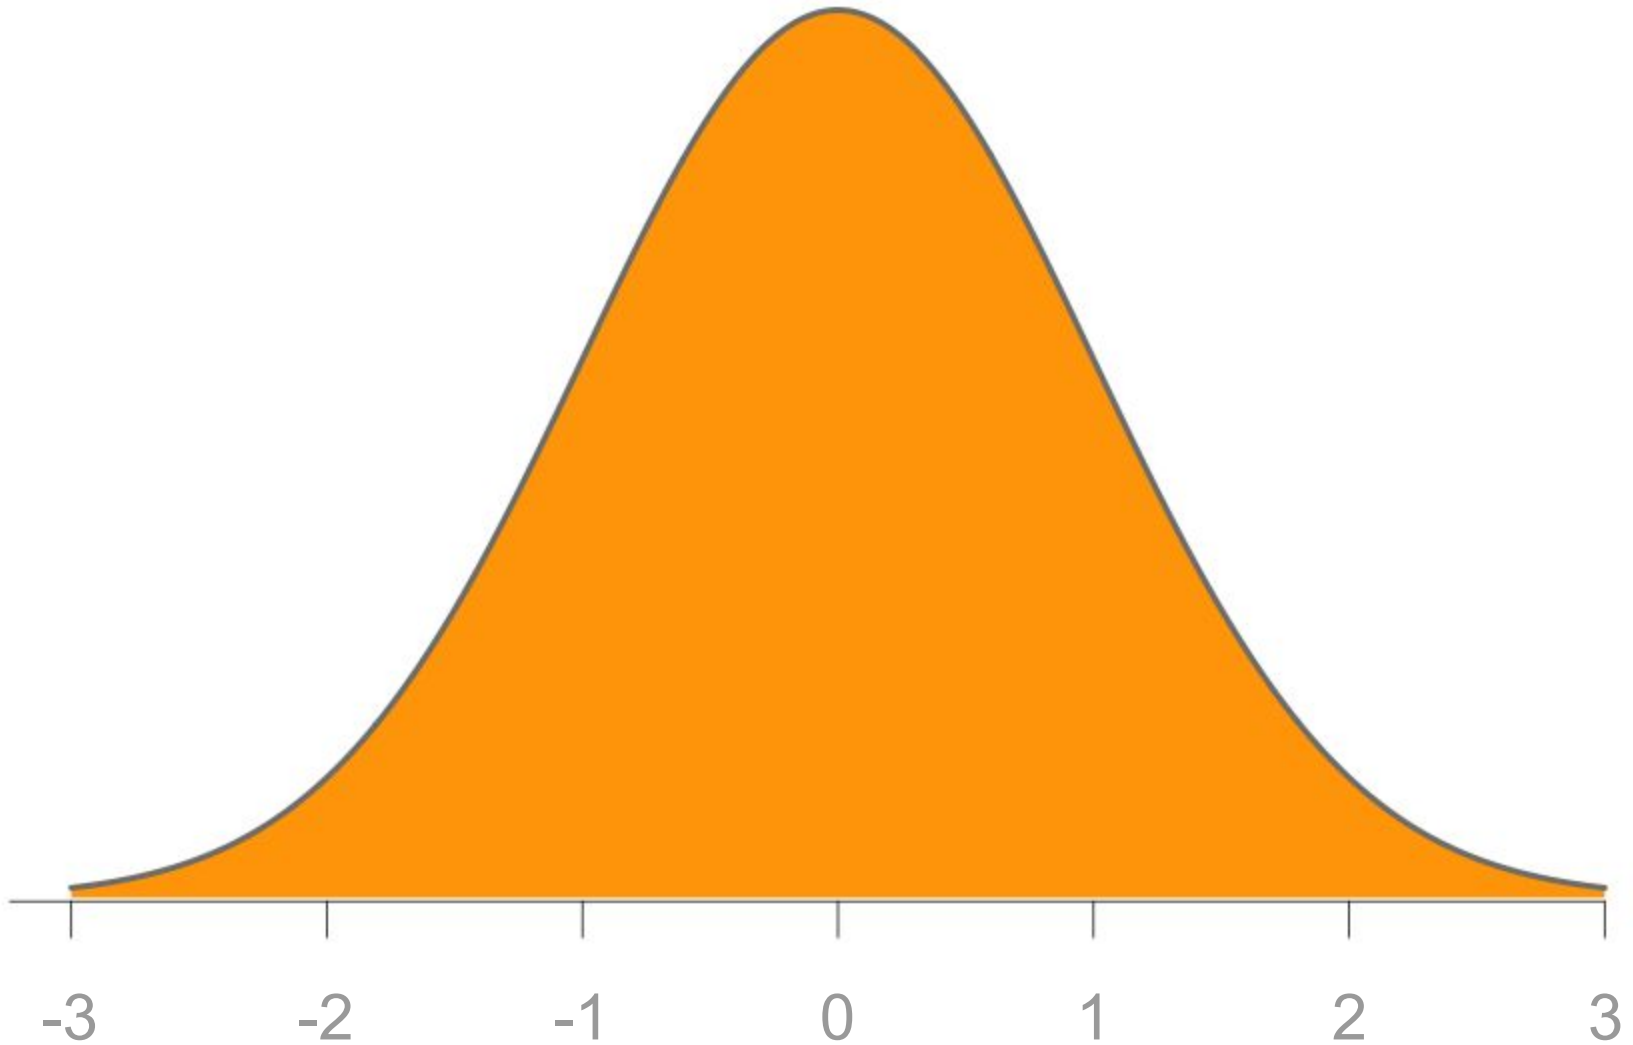

## Normal Curve

# Normal Curve

Total Area under the curve = 1

## About the normal curve

The normal curve is a histogram: total area under curve is 100%

Symmetric around 0

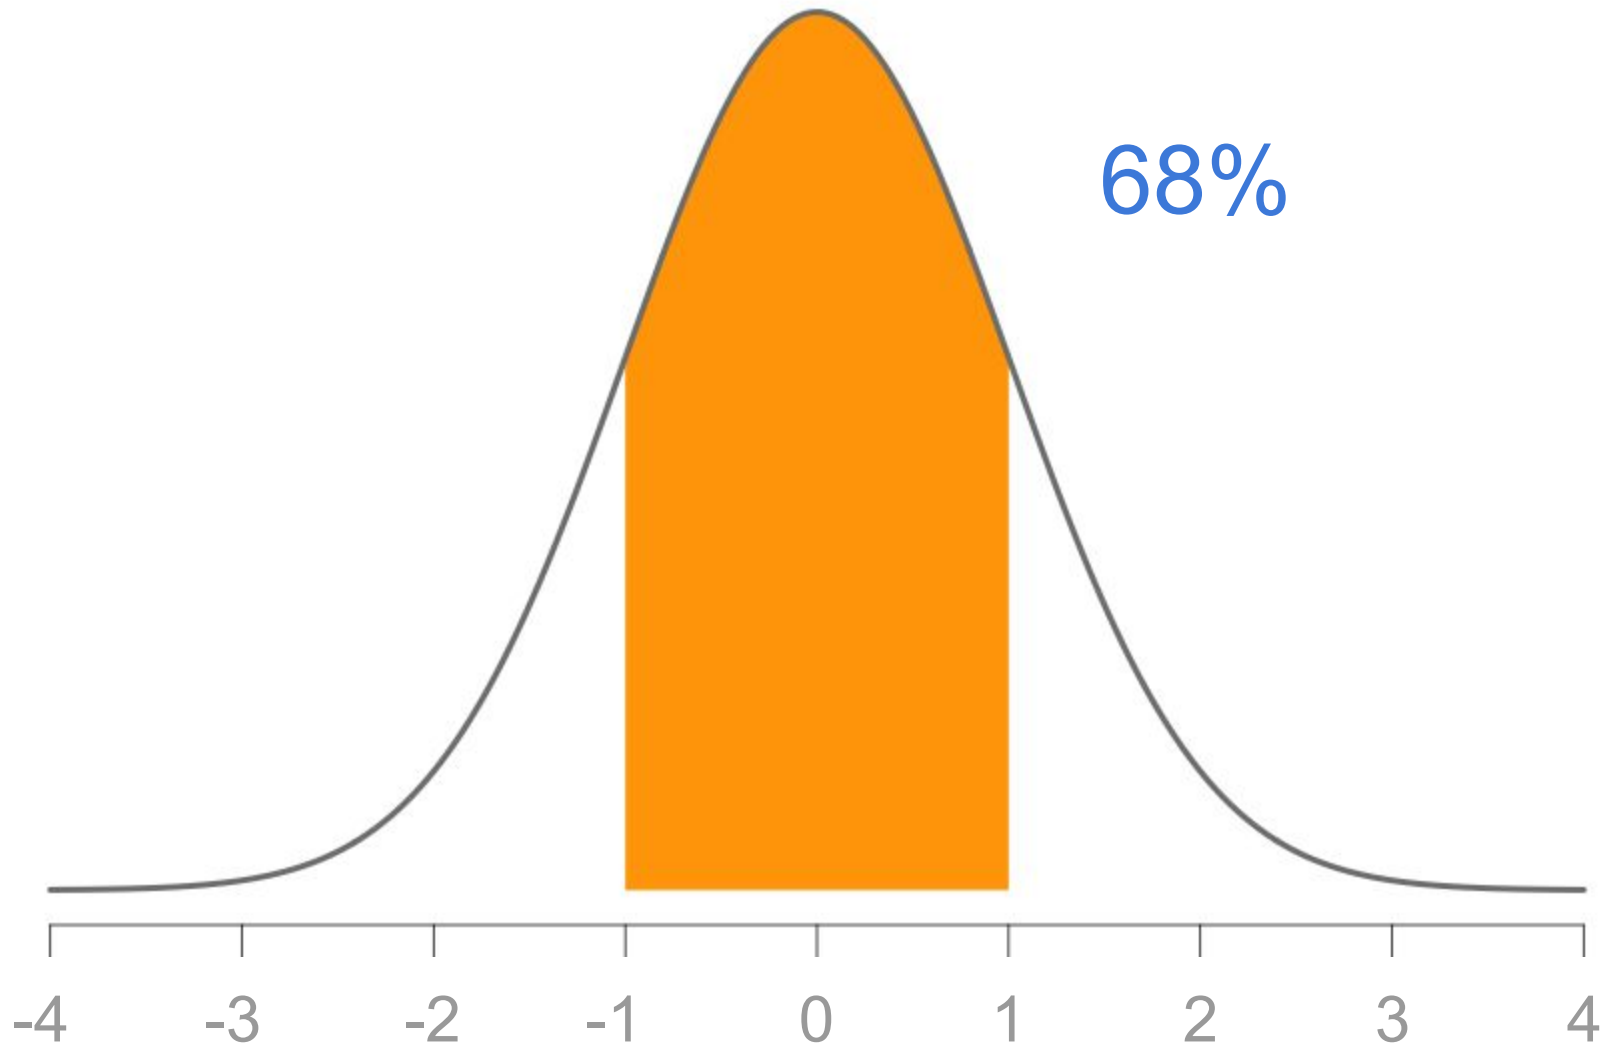

Gets small very fast (x's farther away from 0, y's closer to 0)

Y-axis never touches 0 and has maximum at 0

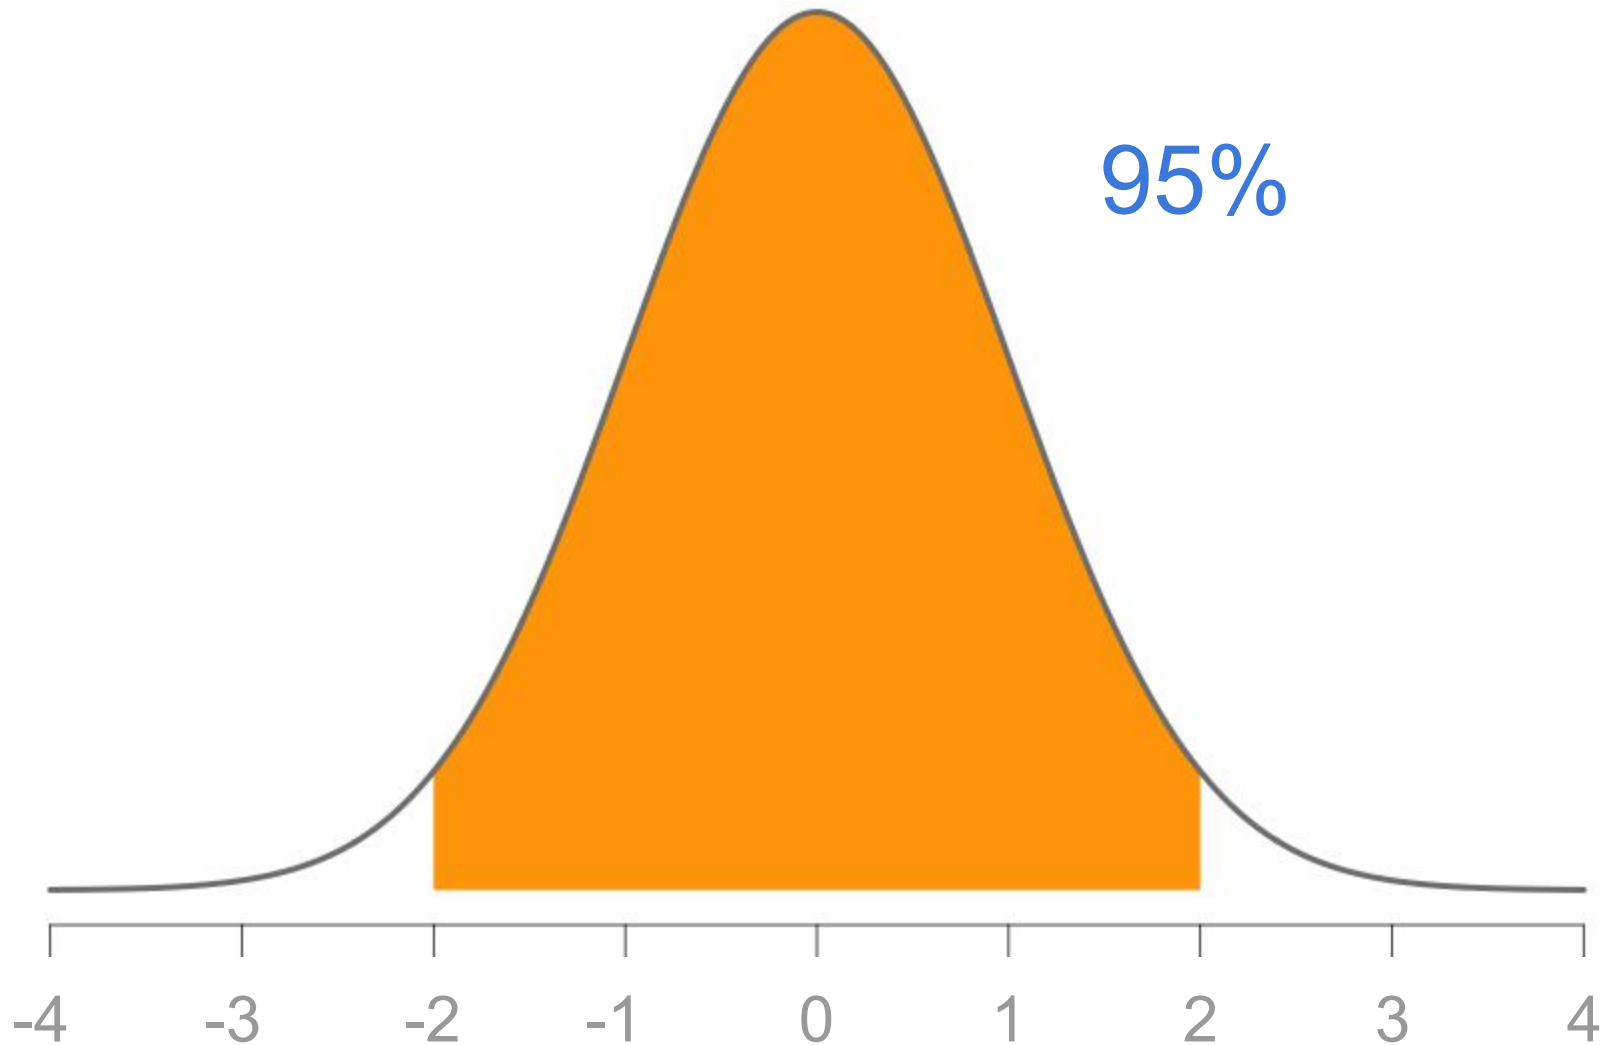

Theoretically, X-axis has infinite range

# The 68-95-99.7 rule

68% of area between -1 and 1

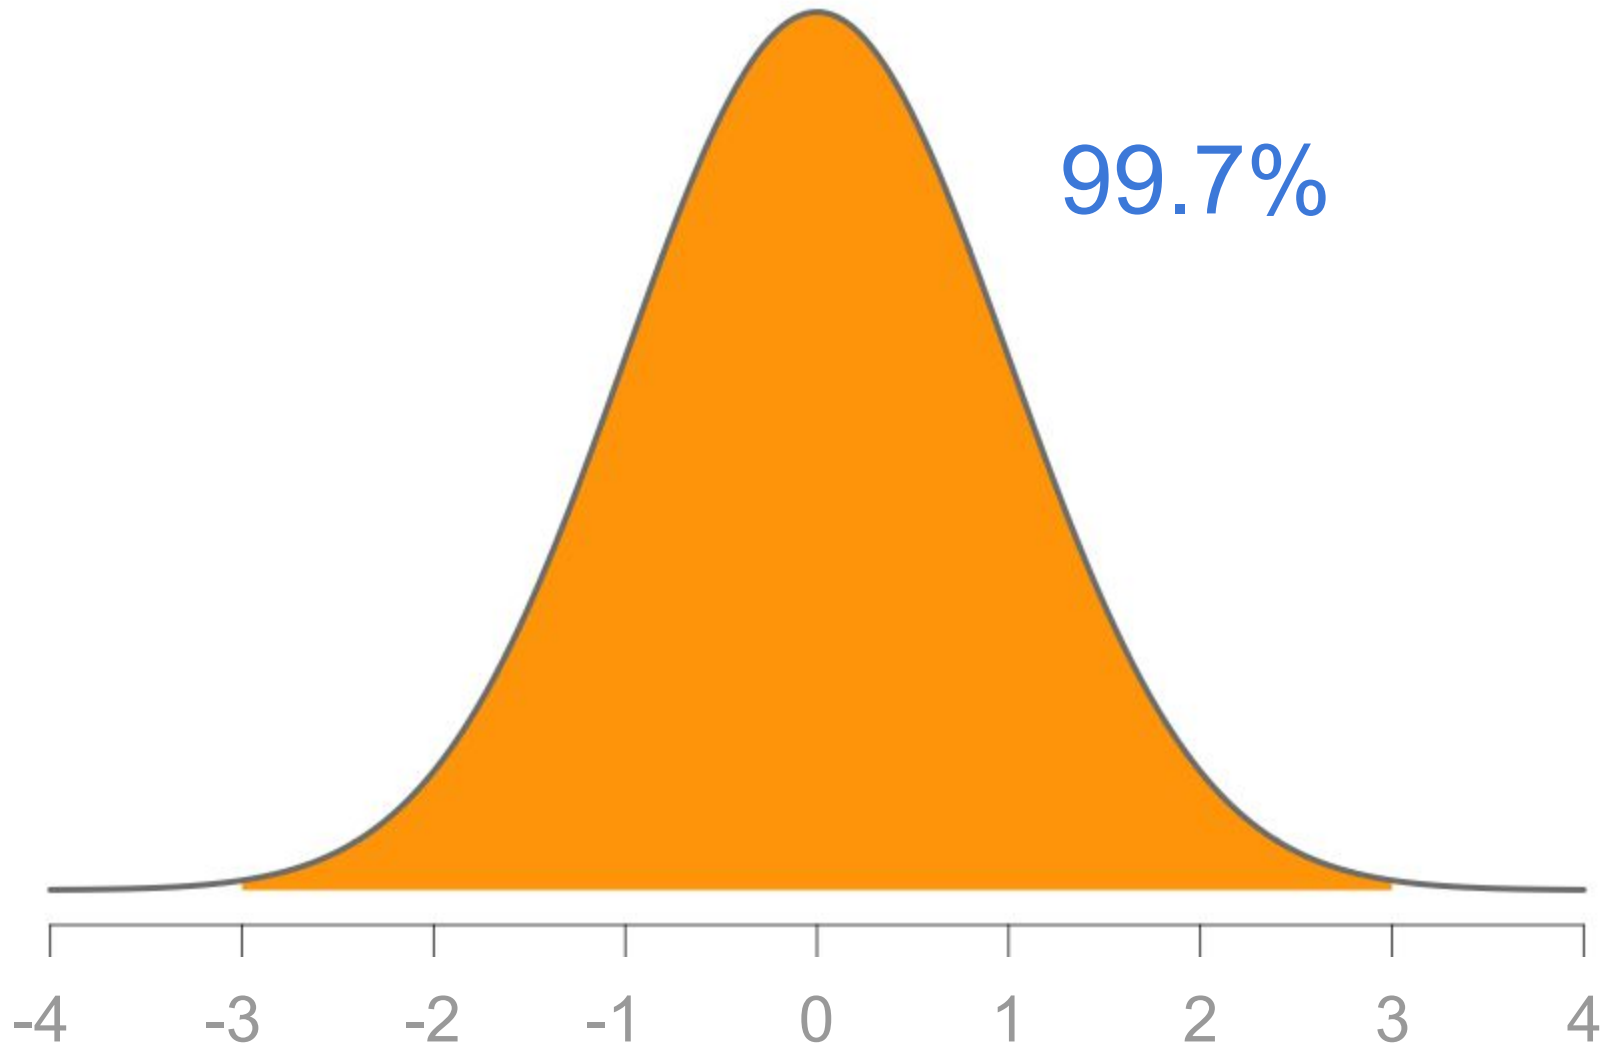

95% of area between -2 and 2

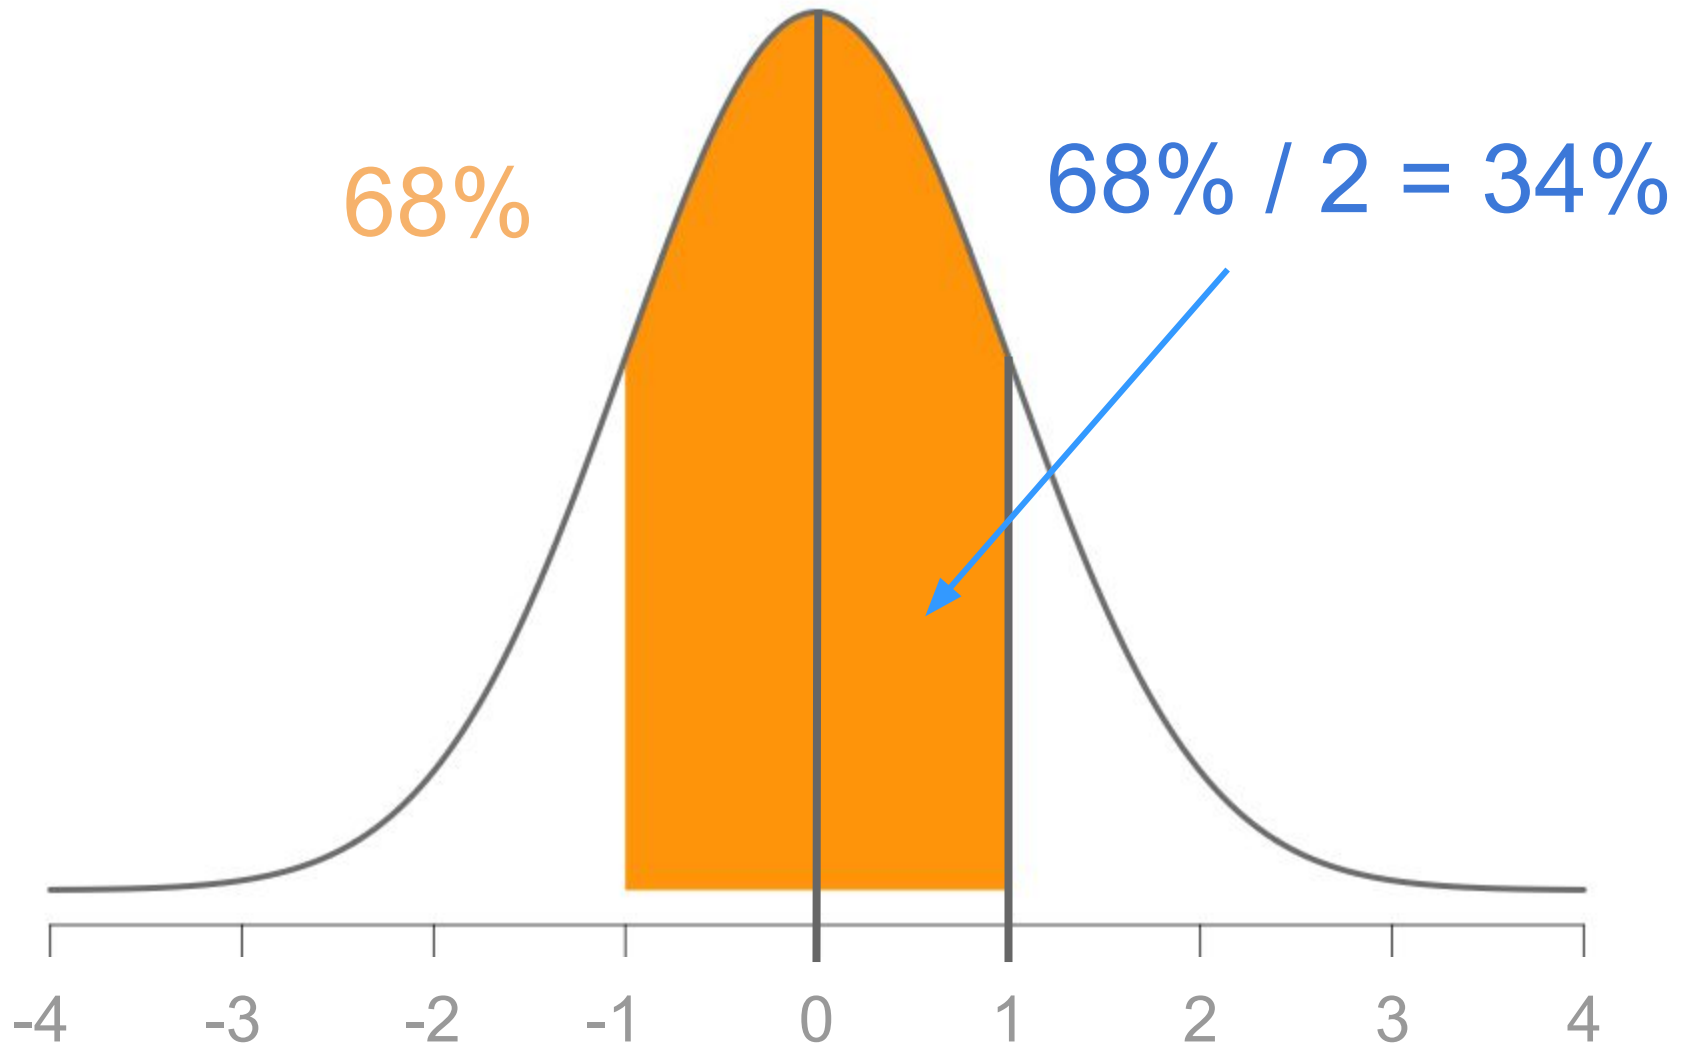

99.7% of area between -3 and 3

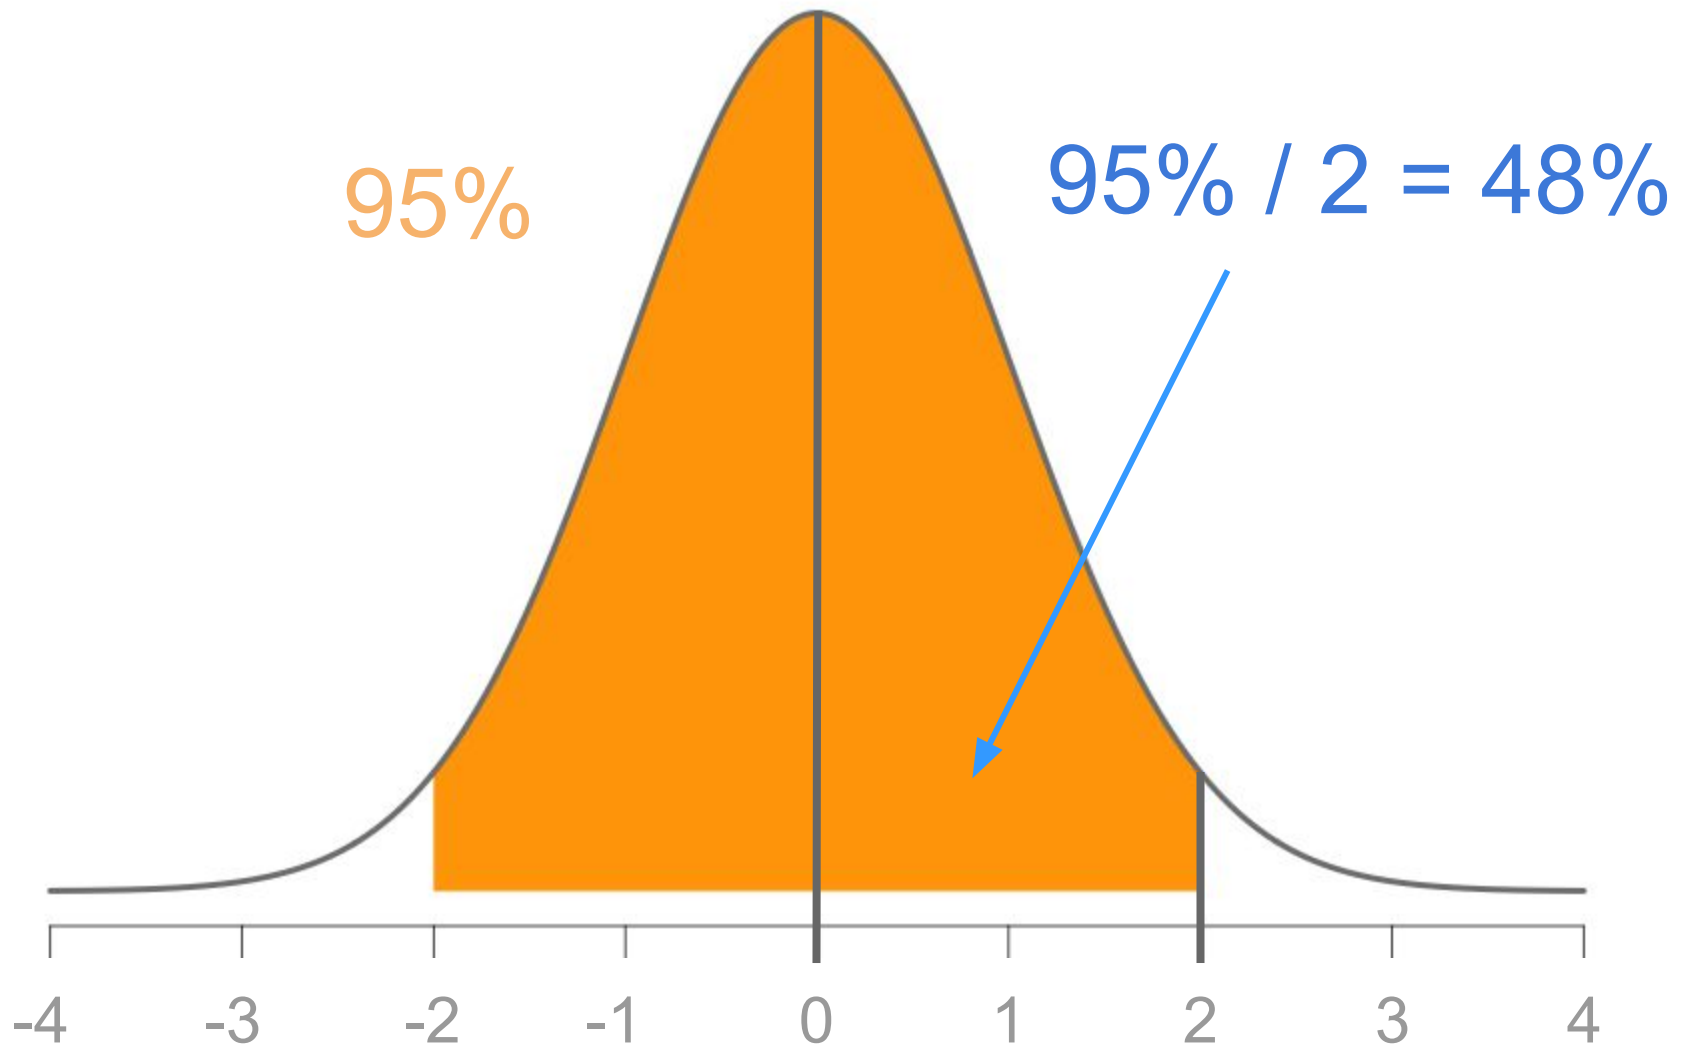

# Finding Areas Under the Normal Curve

# Finding areas under the normal curve

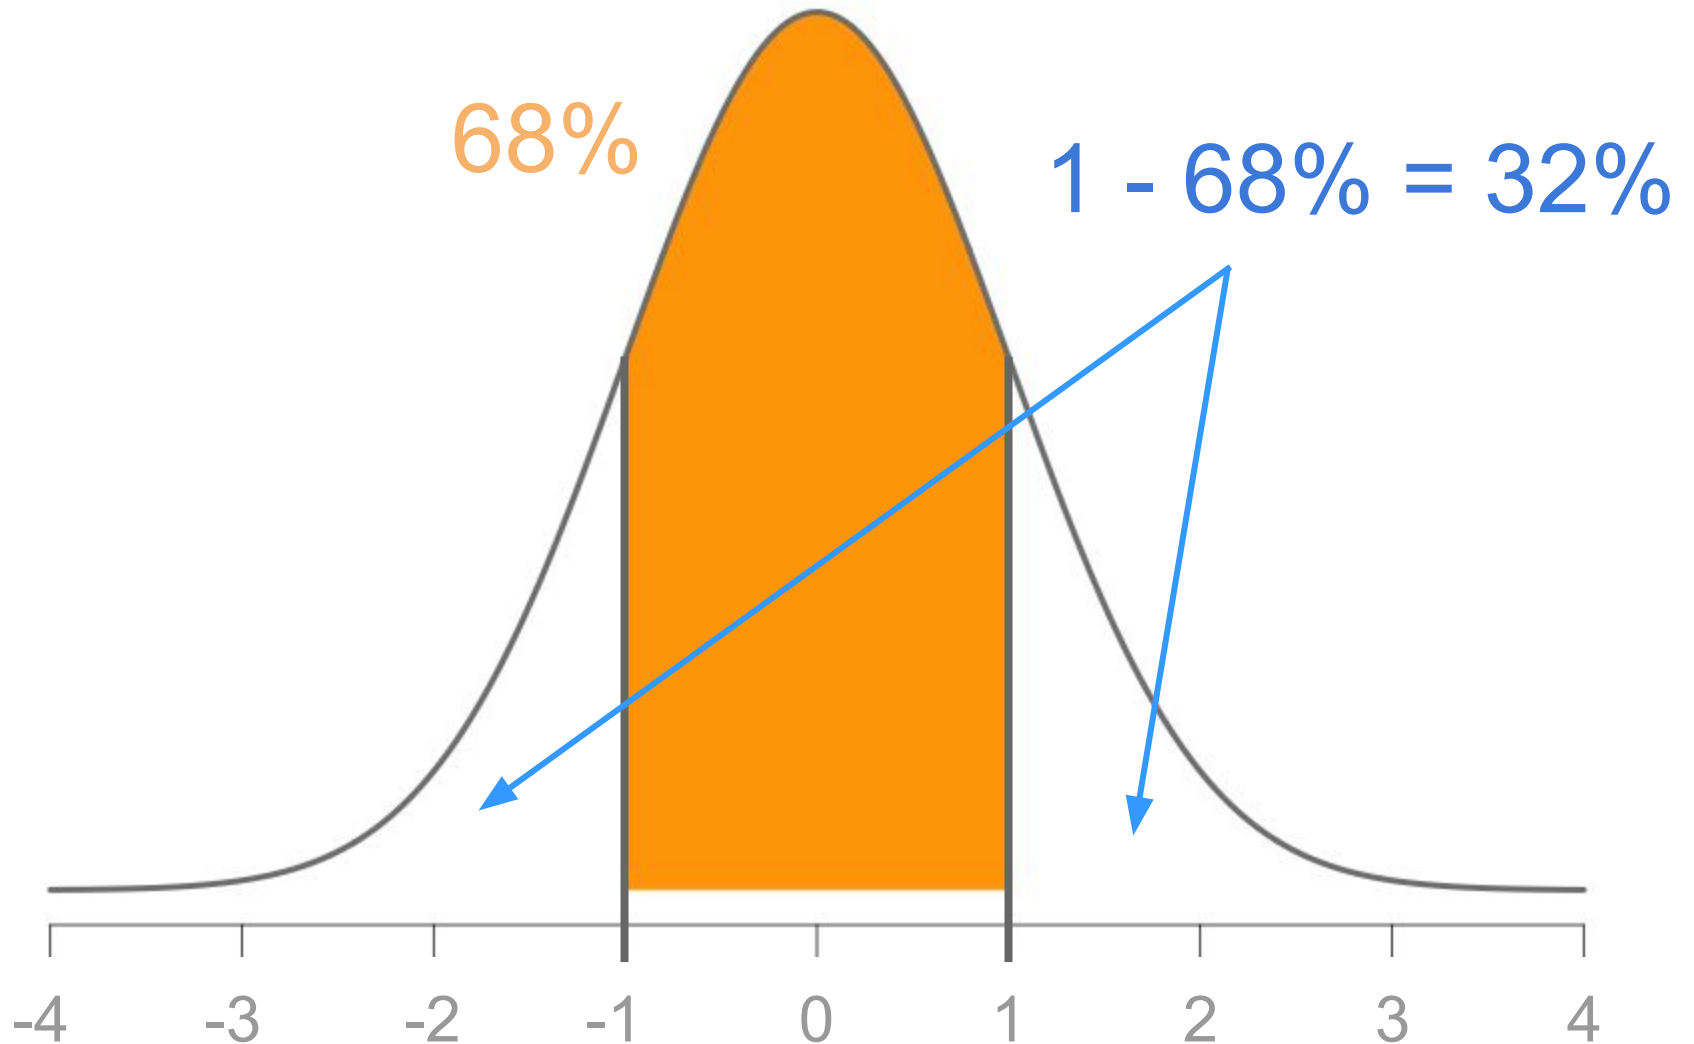

68% of area within 1 unit from 0

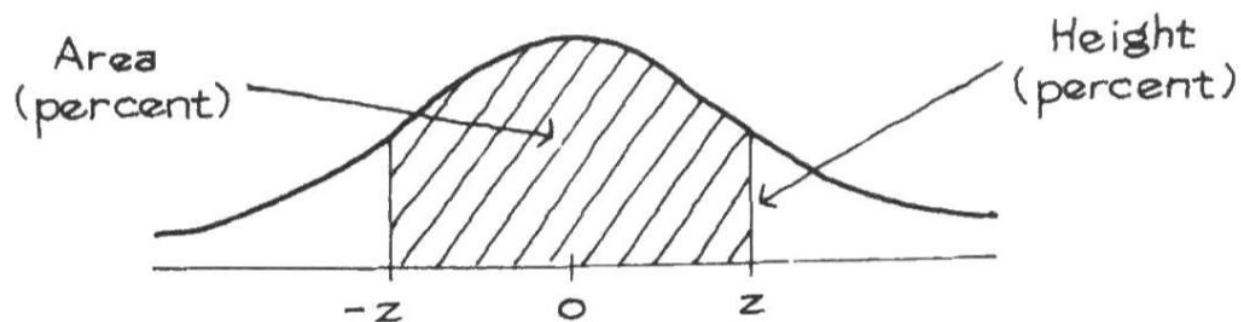

95% of area within 2 units from 0

68% of area within 1 unit from 0

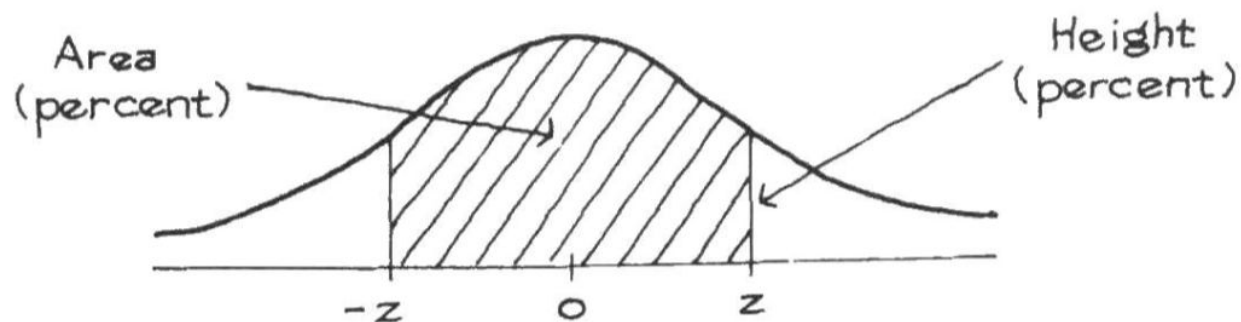

How to find more  
general type of areas  
under the normal curve?

## Area within a given range?

Area within -0.3 and 0.3 = 23.58

Area within -0.3 and **0.0** =  $23.58 / 2 = 11.79$

Area within -0.4 and 0.4 = 31.08

Area within **0.0** and 0.4 =  $31.08 / 2 = 15.54$

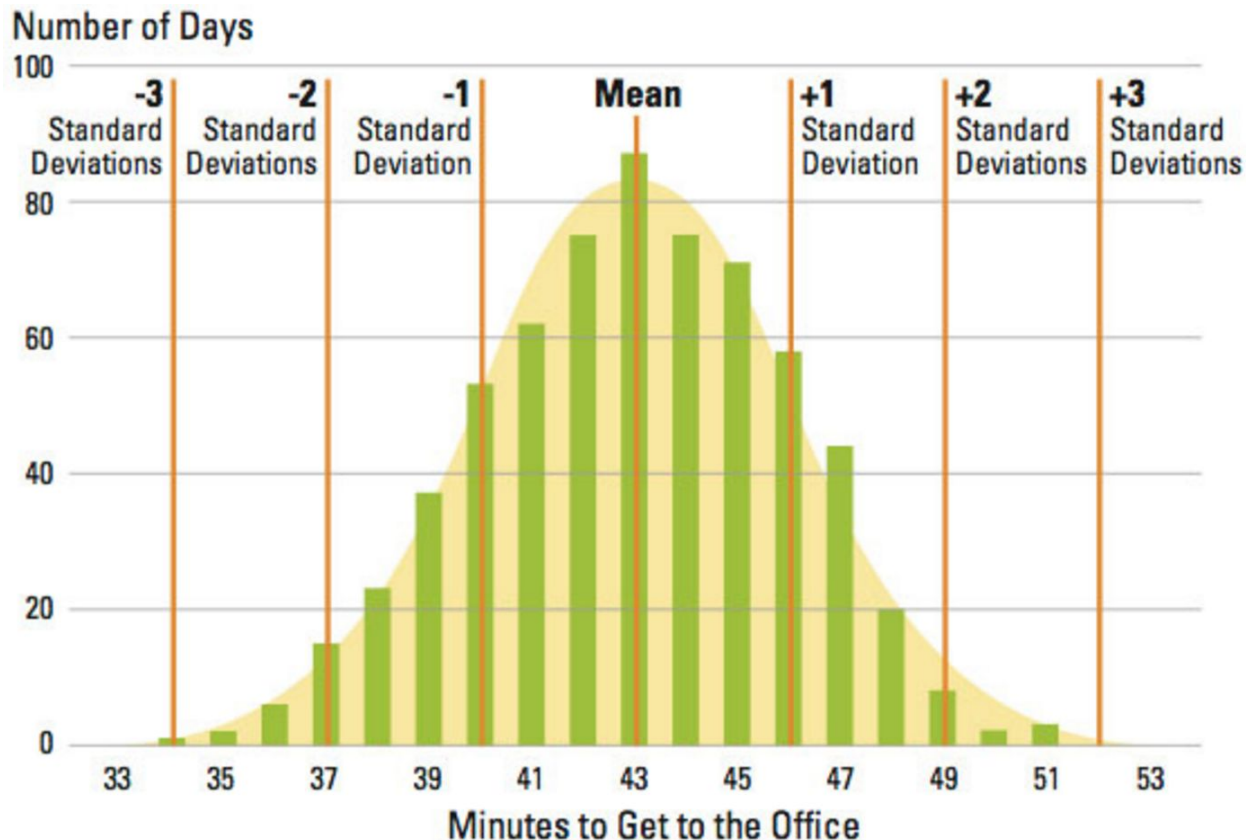

Area within -0.3 and 0.4 =  $11.79 + 15.54 = 27.33$

# Standard Units

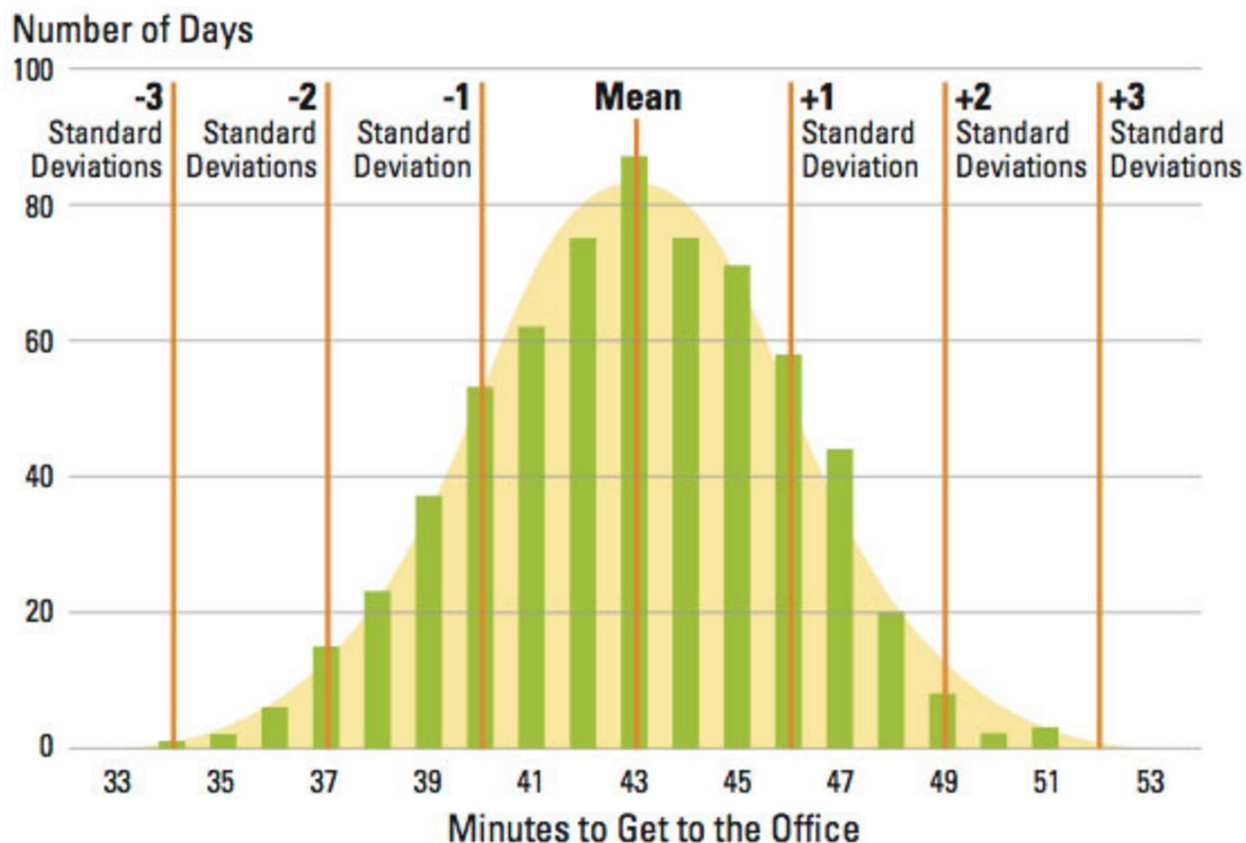

# Normal Approximation

Many histograms for data are similar in shape to the normal curve, provided they are drawn to the same scale.

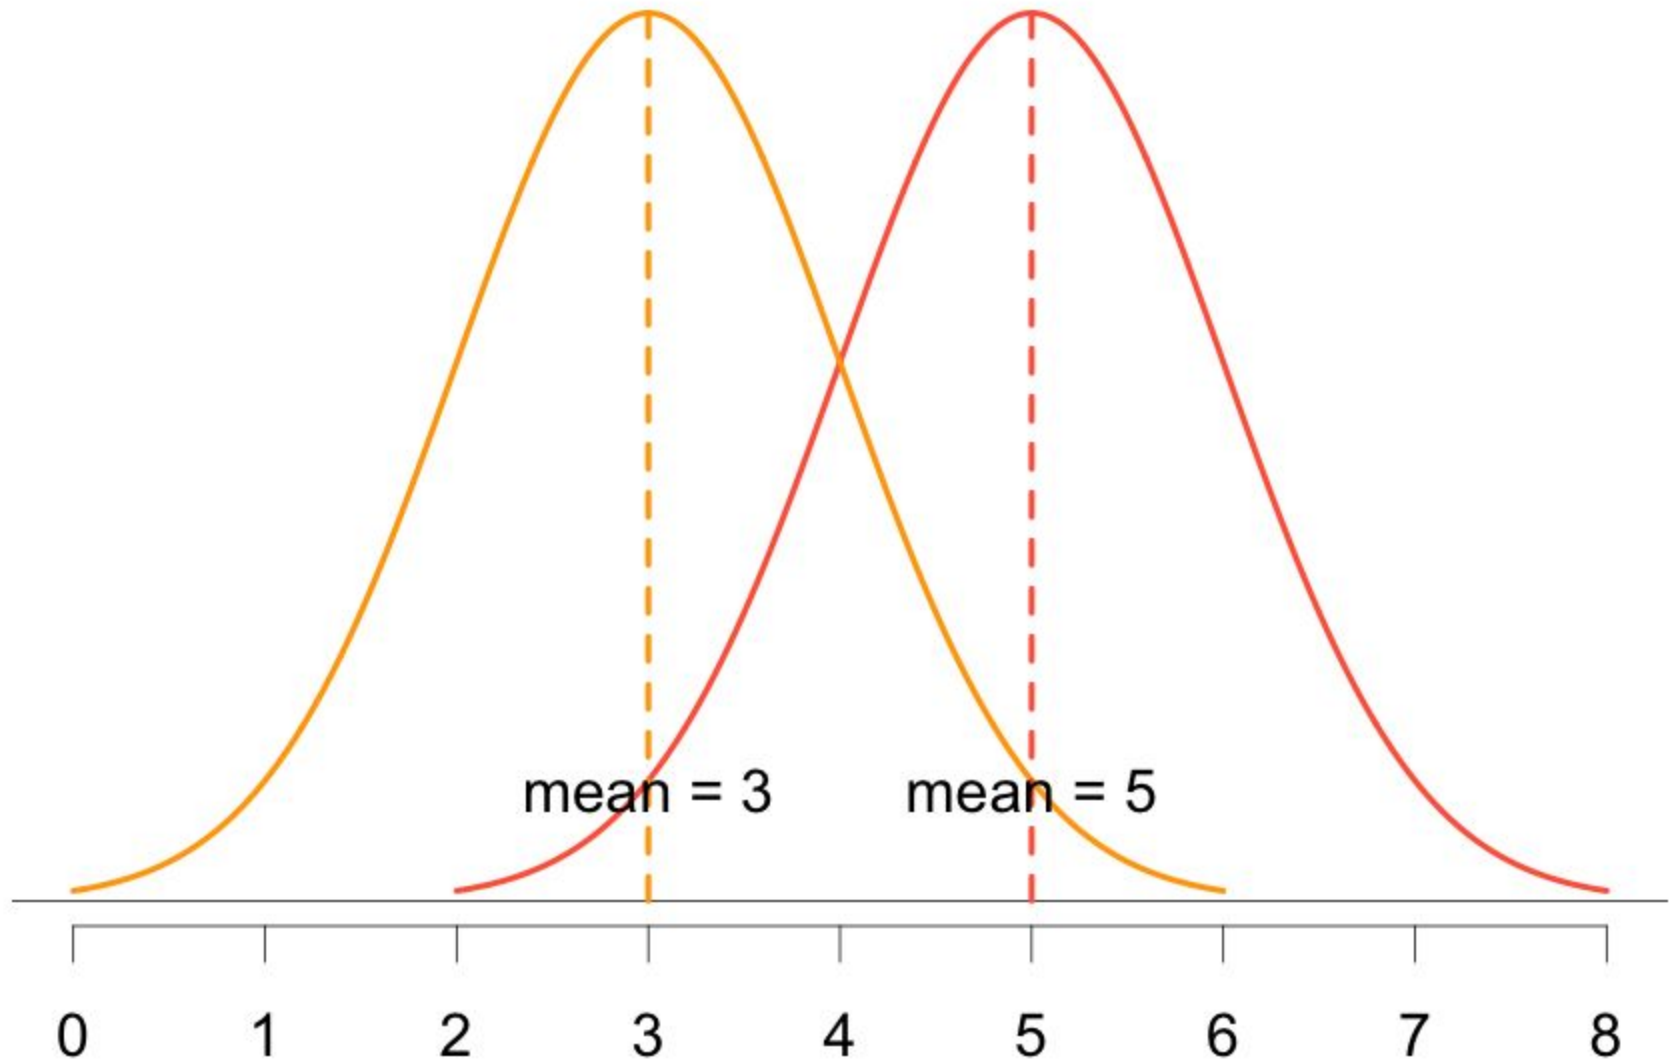

# Normal Approximation

Making the horizontal scales match up involves **standard units**.

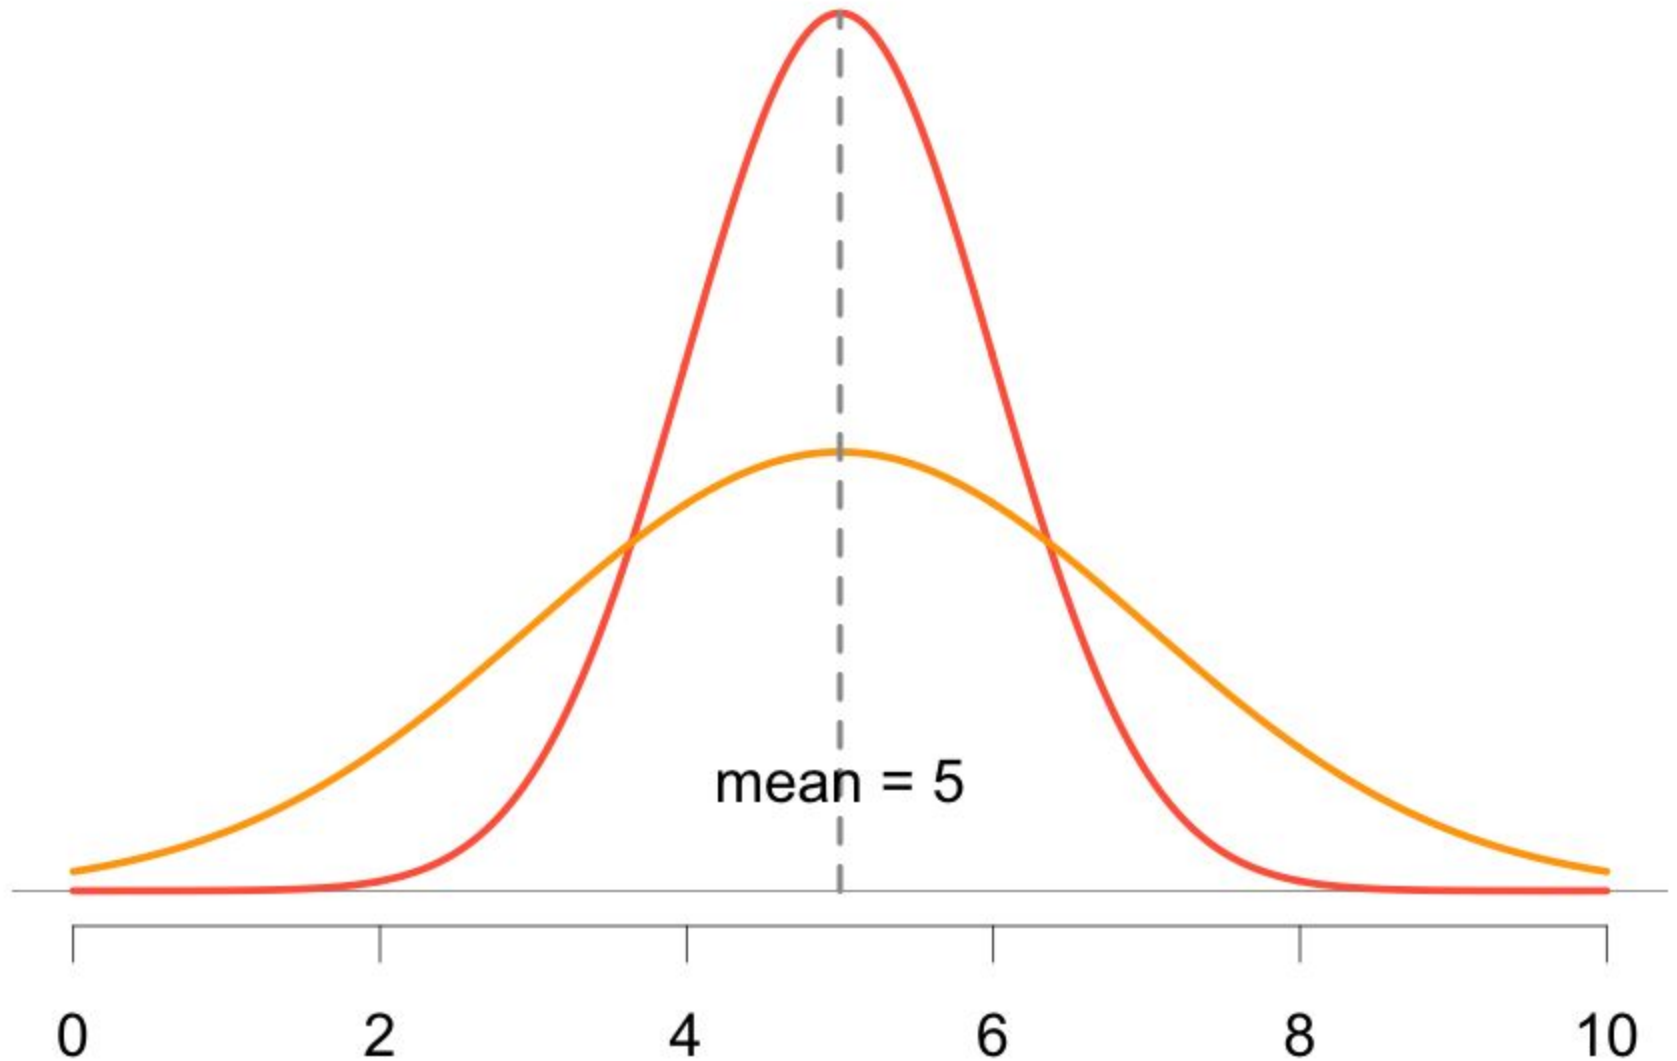

There is actually an  
infinite number of  
normal curves

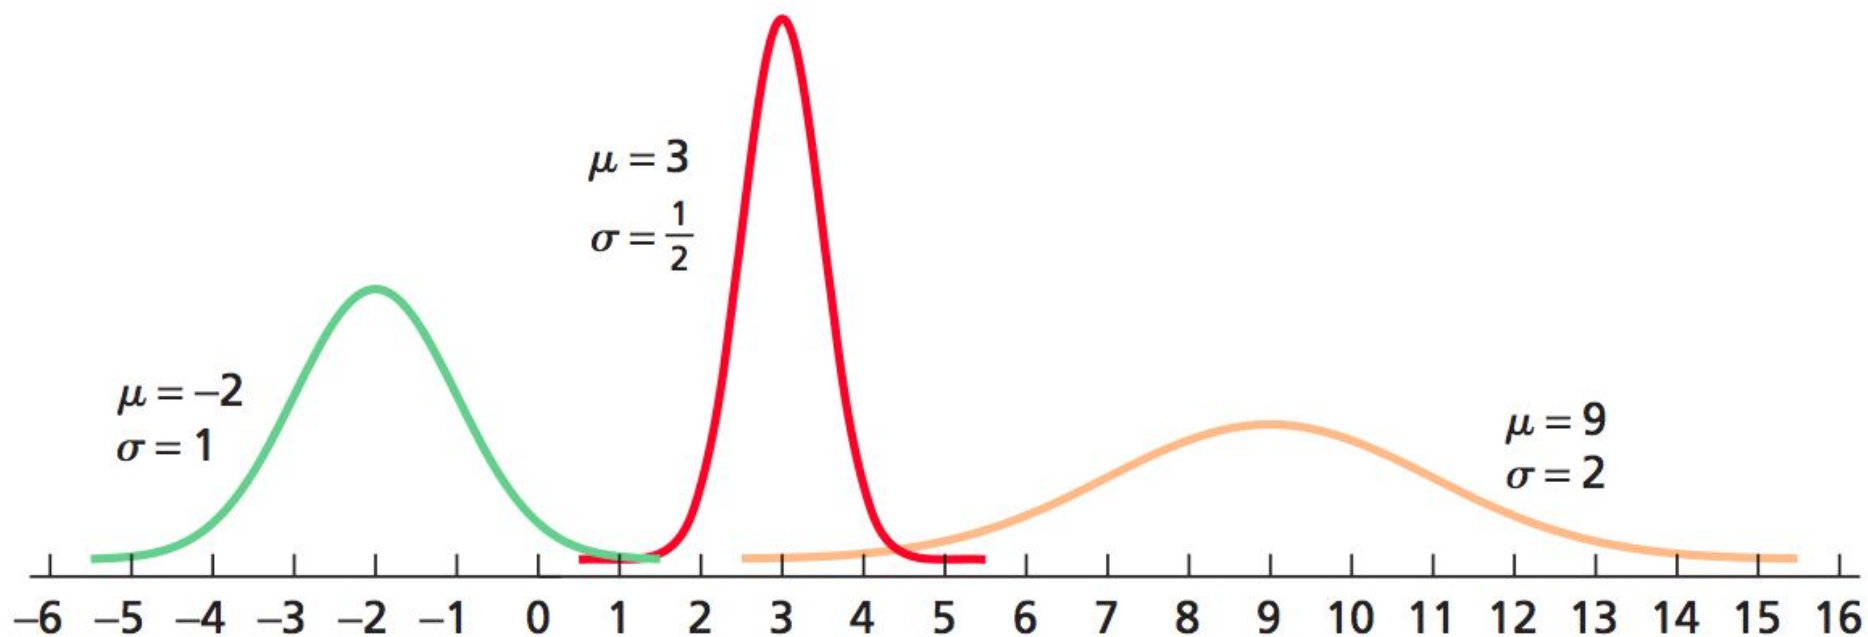

Different average, same SD

Same average, different SD

# Three normal distributions

## Standard Units

**SU**: Measures how many SDs a value is above or below the average

$$SU = \frac{\text{value} - \text{average}}{SD}$$

## Converting to Standard Units

Height of a group of women with:

average of **63.5** inches

SD of **3** inches

One woman has a height **66.5** inches

What is this woman's height in SU?

$$\text{SU} = \frac{66.5 - 63.5}{3} = 1$$

## Converting to Standard Units

$$\text{SU} = \frac{66.5 - 63.5}{3} = 1$$

**66.5** inches is 3 inches above the average  
*i.e.* 1 SD above the average

## Converting to Standard Units

Height of a group of women with:

average of **63.5** inches

SD of **3** inches

Another woman has a height **61.5** inches

What is this woman's height in SU?

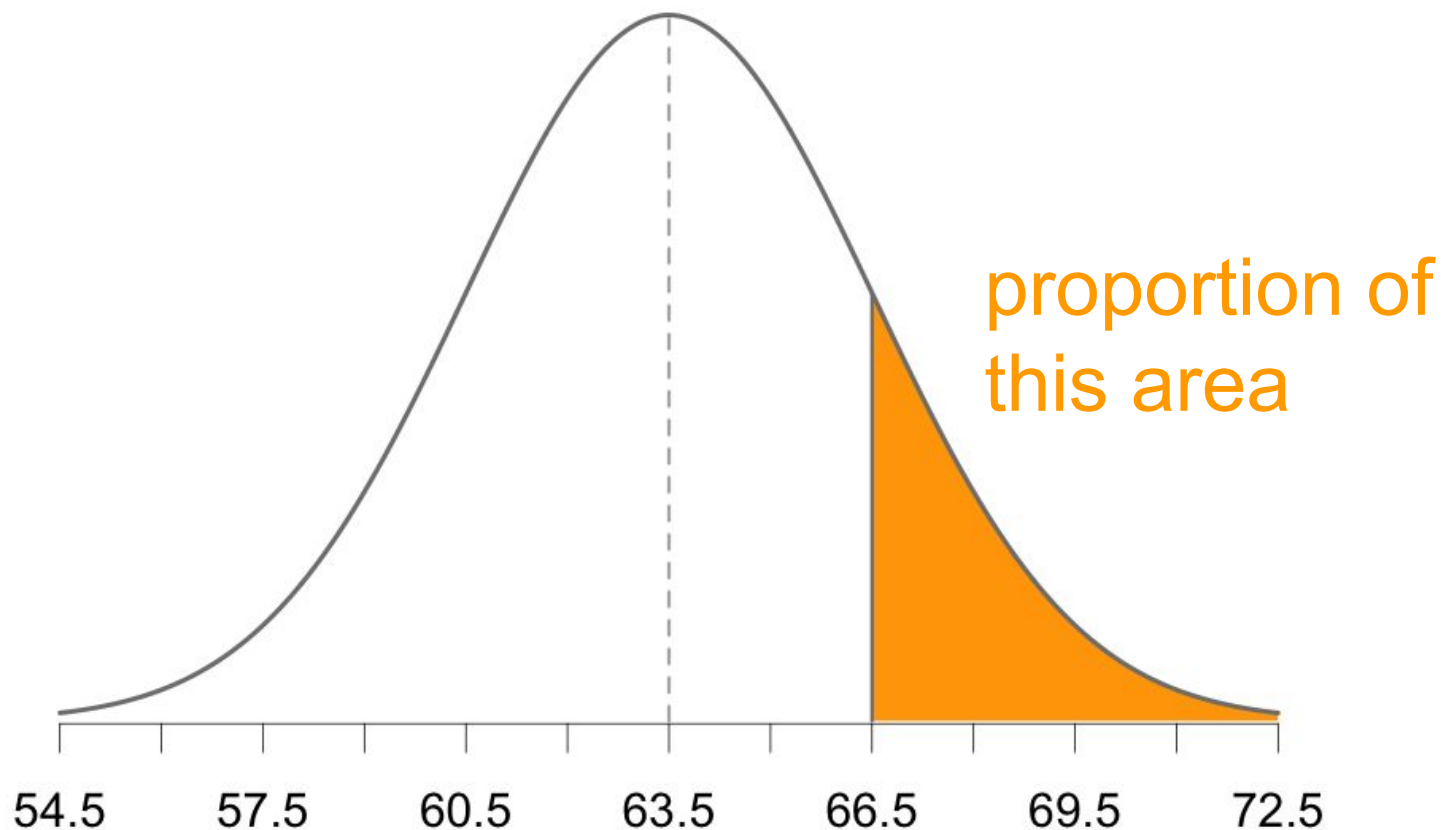

$$\text{SU} = \frac{61.5 - 63.5}{3} = -2/3$$

## Converting to Standard Units

$$\text{SU} = \frac{61.5 - 63.5}{3} = -2/3$$

**61.5** inches is 2 inches below the average  
*i.e.* 2/3 SD below the average

About what percent of women are taller than the woman with height **66.5** inches?

About what percent of women are taller than the woman with height **66.5** inches?

converting to  
standard units
